

# Computer Networking: A Top Down Approach

Chapter 1

# Computer Networks and the Internet

# CS-3001 Computer Networks

- **Instructor:** Salma Kulsoom
- **Classes:** Monday, Wednesday
- **Communication and announcements:** Everything on Slate
- **Counselling hours:** Monday 2:30 PM to 4:00 PM
- **Text book:** Computer Networking by James F. Kurose
- **Grading Policy;**
  - Assignments: 10%
  - Quies: 10%
  - Mids: 30%
  - Final: 50%

# Objectives

- Get into basics of networking
- Types of connections
- Circuit Switching
- Packet switching (Datagram and Virtual circuit)

# Content

1. What is internet?
2. Internet nuts and bolts (Components of internet)
3. Edges and core of internet
4. Network protocols
5. Connection oriented and connectionless services
6. Point to point and multipoint connection
7. Circuit switching
8. Frequency division multiplexing
9. Time division multiplexing
10. Packet switching
11. Datagram
12. Virtual circuit switching
13. Practice questions

# Computer Network

- **Computer Network:** Two or more devices that are connected with one another for the purpose of communicating data electronically.
- A cohesive architecture that allows a variety of equipment to transfer information in a near-seamless fashion.
- **Internet:** Global computer network where networks from around the world are connected through standard protocols.

# Nuts and Bolts View of Internet

- Core components that formulates an internet.
- **Software:** Network applications, Protocols, Operating System
- **Hardware:**
  - End Systems -> Sender, Receiver, Host, Node, Client, Servers
  - Host
  - Communication link -> Channel, media, medium, connection,
  - Switch
  - Hub
  - Router
  - Modem
  - Base station
  - Satellite Links
  - Repeaters

# Nuts and Bolts of Internet

Router

Hub

Bridge

ISP

Base Station

Wireless  
Router

Switch

Wireless  
Bridge

Modem

Satellite Link

# Edges and Core of Network

- Edges: End devices, clients, servers
- Core: Router, Gateways, Bridges, Switches

# Internet Protocols

## *human protocols:*

- “what’s the time?”
- “I have a question”
- introductions

... specific messages sent

... specific actions taken  
when messages  
received, or other  
events

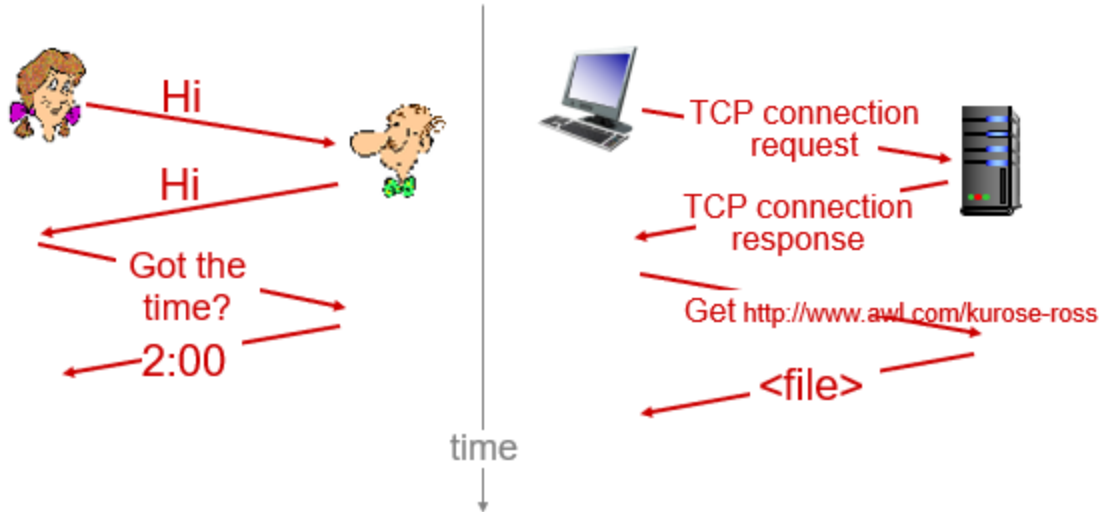

## *network protocols:*

- machines rather than humans
- all communication activity in Internet governed by protocols

*protocols* define *format, order* of  
*messages sent and received*  
among network entities, and  
*actions taken* on message  
transmission, receipt

# Internet Protocol

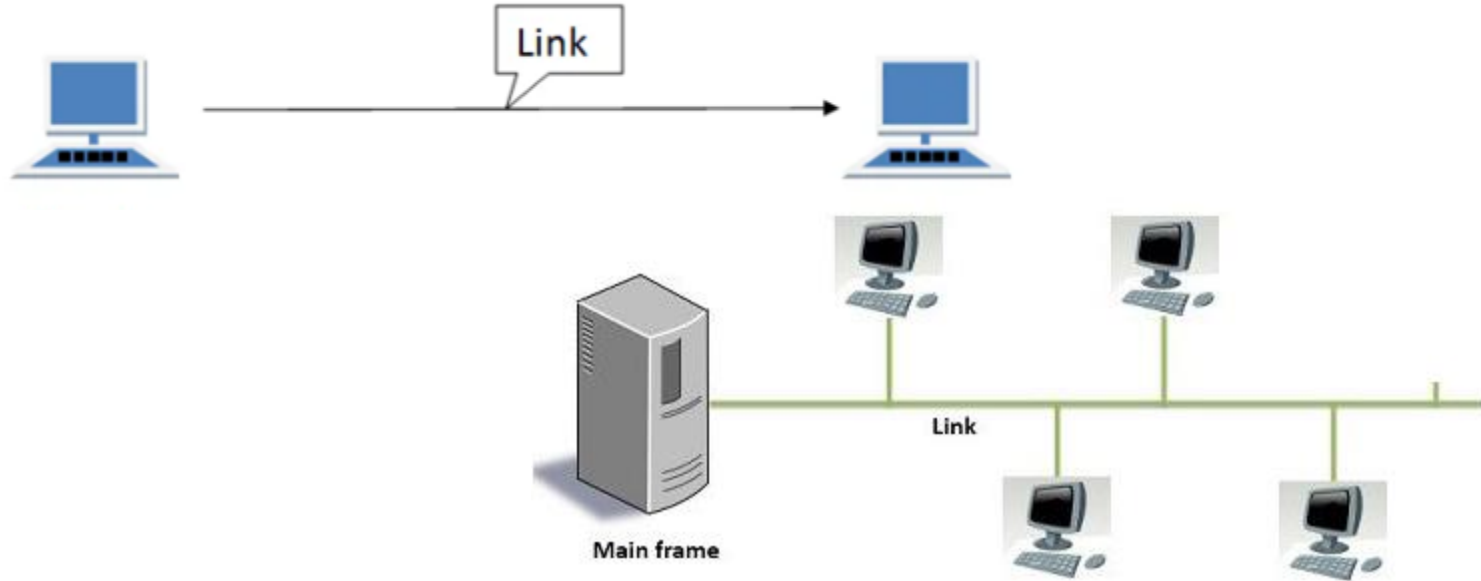

a human protocol and a computer network protocol:

# Components of Data Communication

# Point to Point Vs Multipoint

# Connection Oriented Services

- Works on basis of Hand-shaking protocol

# Connectionless Services

**CONNECTIONLESS SERVICE**

# Circuit Switching

**Setup time**= Time required for establishing setup

**Transmission time**= Number of bits in message/ Bandwidth

**Propagation delay**= Distance/ Speed

**Teardown time**= Time required for releasing resources

**Total Transmission Time**= Setup time + Transmission time + Propagation delay + Teardown Time  
Total transmission time is also called total delay.

# Packet Switching

The original message is Green, Blue, Red.

$n$  = number of routers

**Transmission time** = Number of bits in message / Bandwidth

**Propagation delay** = Distance / Speed

**Teardown time** = Time required for releasing resources

Total transmission delay also includes queuing delay and processing delay at each hop (hop is a point or a router from where packets are transmitted to next node.) If they are not mentioned, then ignore them.

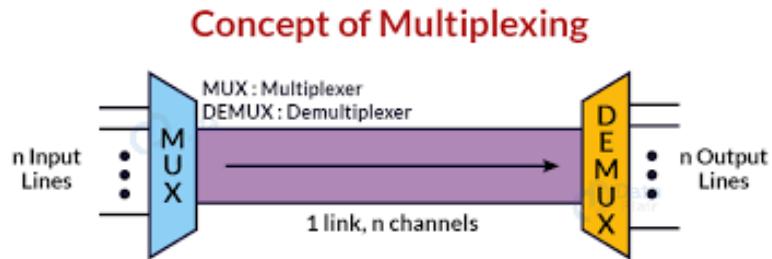

**Total Transmission Time** =  $n(\text{Transmission time}) + \text{Propagation delay}$

# Multiplexing in Circuit Switching

**Multiplexing:** Combining multiple analog or digital signals into one composite signal that is transported over a communication medium.

**Demultiplexing:** Converting a single signal with multiple streams into separate signals in order to transform it back into their original form.

# Frequency Division Multiplexing

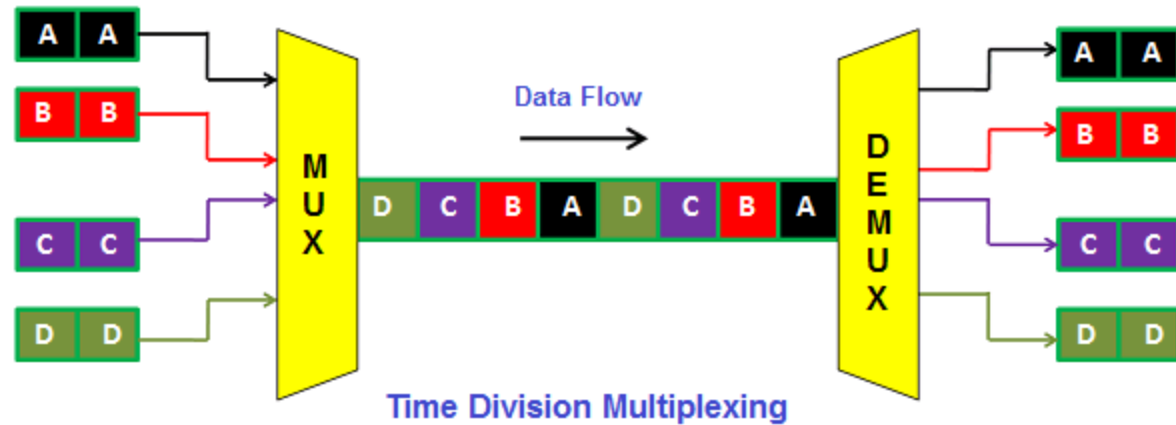

**Total Transmission Time**= Setup time + Transmission time + Propagation delay + Teardown Time

Since bandwidth is divided among slots:

Bandwidth per slot= total bandwidth/ number of slots

# Time Division Multiplexing

**Total Transmission Time**= Setup time + Transmission time + Propagation delay + Teardown Time

Since bandwidth is divided among slots:

Bandwidth per slot= Total bandwidth/(number of frames \* bits in each frame)

# Datagram Packet

- Pure packet switching
- No reservation of packets
- No order of packets
- Packets randomly choose any path
- Headers associated with each packet
- Frequent packet loss
- More efficient

# Virtual Packet Switching

Connection less, do not work on hand-shaking principle

Less efficient

More wastage of resources

Global header only with first packet

Less overhead

Less dealy

# Practice Exercises

- Mentioned in the self study material

**To be continued..**
